yoga-project

Getting Started with Create React App

This project was bootstrapped with [Create React App](https://github.com/facebook/create-react-app).

Available Scripts

In the project directory, you can run:

`npm start`

Runs the app in the development mode.\
Open http://localhost:3000 to view it in your browser.

The page will reload when you make changes.\
You may also see any lint errors in the console.

`npm test`

Launches the test runner in the interactive watch mode.\
See the section about [running tests](https://facebook.github.io/create-react-app/docs/running-tests) for more information.

`npm run build`

Builds the app for production to the `build` folder.\
It correctly bundles React in production mode and optimizes the build for the best performance.

The build is minified and the filenames include the hashes.\

Your app is ready to be deployed!

See the section about [deployment](https://facebook.github.io/create-react-app/docs/deployment) for more information.

`npm run eject`

Note: this is a one-way operation. Once you `eject`, you can't go back!

If you aren't satisfied with the build tool and configuration choices, you can `eject` at any time. This command will remove the single build dependency from your project.

Instead, it will copy all the configuration files and the transitive dependencies (webpack, Babel, ESLint, etc) right into your project so you have full control over them. All of the commands except `eject` will still work, but they will point to the copied scripts so you can tweak them. At this point you're on your own.

You don't have to ever use `eject`. The curated feature set is suitable for small and middle deployments, and you shouldn't feel obligated to use this feature. However we understand that this tool wouldn't be useful if you couldn't customize it when you are ready for it.

Learn More

You can learn more in the [Create React App documentation](https://facebook.github.io/create-react-app/docs/getting-started).

To learn React, check out the [React documentation](https://reactjs.org/).

Code Splitting

`npm run build` fails to minify

This section has moved here: https://facebook.github.io/create-react-app/docs/troubleshooting#npm-run-build-fails-to-minify

Create React App is a tool to help you quickly set up a new React project with minimal configuration.

Available Scripts: You can use various npm scripts to run your app, test it, build it for production, or eject from the default setup.

npm start: Runs the app in development mode at http://localhost:3000

npm test: Launches the test runner in interactive watch mode.

npm run build: Builds the app for production, optimizing for performance.

npm run eject: Removes the single build dependency and copies all configuration files to your project, allowing you to fully customize the build process.

Learn More: Consult the Create React App documentation and the React documentation for more information.

Additional Topics: The document also provides links to more advanced topics like code splitting, analyzing bundle size, making a progressive web app, advanced configuration, and deployment.

Remember that Create React App is an excellent starting point for building React applications, but you may need to customize it further as your project grows and requires more advanced features

thanks for read this
